

<b>GO-ON®</b> Product Information <b>GB</b>	<b>This product should only be used by qualified persons who are familiar with its use.</b>  <b>Description</b> GO-ON® is a sterile non-pyrogenic solution of Sodium Hyaluronate.  <b>Composition</b> A syringe of GO-ON® contains 2.5 ml of a 1% Sodium Hyaluronate solution as well as sodium chloride, sodium monohydrogen phosphate, sodium dihydrogen phosphate and water for injection.  <b>Characteristics</b> Sodium Hyaluronate is a natural high molecular weight polysochinate composed of a linear chain of disaccharide units made by sodium glucuronate and N-acetylglucosamine. Sodium Hyaluronate is widely distributed throughout the tissues of the human body and is present in high concentrations in the synovial fluid, of which it is the major component. Sodium Hyaluronate plays a significant role in modulating the physical and mechanical interaction between adjacent tissues functioning as a tissue lubricant; it also serves as a viscoelastic support maintaining separation between tissues. In the elderly: the product must be administered with caution, since physiological functions are reduced in these patients. <i>Paediatric use:</i> GO-ON® is a 1% Sodium Hyaluronate solution obtained from <i>Streptococcus Equi</i> by fermentation processes and subsequent purification.  <b>Indications</b> GO-ON® is indicated as a viscoelastic supplementation for synovial fluid in knee and shoulder joints. GO-ON® is also indicated as viscoelastic supplementation in other synovial joints. The actions of the product are lubrication and mechanical support and it is suitable for treatment of the symptoms of osteoarthritis.  <b>Contraindications</b> GO-ON® must not be used in patients with a history of hypersensitivity to any of the ingredients of the product and in the case of inflammatory joint diseases such as rheumatoid arthritis or Bechterew disease.  <b>Warnings and Precautions</b> Long-term viscoelastic supplementation with GO-ON® in synovial joints other than the knee and shoulder can be used only in cases appropriate for joint replacement.	<b>Properties and Mode of Action</b> Synovial fluid, which due to its content of Hyaluronic acid is visco-elastic, occurs in all synovial joints but especially in the large weight bearing joints, where its lubricating and shock absorbing characteristics ensure normal, painless movement. It also supplies nutrients to the articular cartilage. Degenerative joint diseases, such as osteoarthritis are associated with a substantial loss of viscosity of the synovial fluid, which impairs its lubricating and shock absorbing functions. This increases the mechanical stress on the joints as well as the loss of articular cartilage to such an extent as to cause pain and loss of function in the affected joints. It has been established that an improvement in the quality of the synovial fluid resulting from an intra-articular injection of Sodium Hyaluronate preparations improves the synovio-elastic properties of the synovial fluid as well as its shock absorbing actions and reduces the mechanical stress on the joint. This results in alleviation of the pain and an improvement in joint mobility, which after a single treatment cycle of 5 intra-articular injections, last for minimum of 6 months.  <b>Dosage and Administration</b> GO-ON® should be injected into the affected joint a total of 5 times, at weekly intervals. Several joints may be treated concurrently. Depending on the severity of the joint disease, the effects of a course of five treatments may last for over 6 months. Treatment cycles may be repeated if required. In the event of adverse reactions, the product is recommended to carry out a course of the infusion, to immobilise the joint, apply an ice bag and/or to administer corticosteroids by intra-articular injection. The treatment with GO-ON® may be repeated 2-3 days later. Remove the syringe from the blister, remove the rubber stopper connection, mount a suitable sterilised needle (e.g. 19 or 21 G) and secure it by a slight turn. Do not over tighten or apply excessive leverage when attaching the needle or removing the needle guard, as this may break the syringe tip.  <b>Side effects</b> Some patients may rarely develop a skin rash, such as urticaria and pruritis. In such cases, discontinue the administration and give the patient the appropriate treatment. Pain (mainly transient pain after administration), swelling and effusion, as well as infection, at the injection site have rarely been reported. Patients may rarely complain of redness, heat sensation and heaviness at the injection site. Shock has been very rarely reported.  <b>Warnings and Precautions</b> Long-term viscoelastic supplementation with GO-ON® in synovial joints other than the knee and shoulder can be used only in cases appropriate for joint replacement.	<b>Symbols on the package</b> Batch number  Use by  Use only once  Attention, see Product information  Sterilised by moist heat  Storage temperature: 2°C-25°C  Manufacturer  Do not use if package is damaged	<b>GO-ON®</b> Navod na použitie, do rukou lékaře. <b>CZ</b>	<b>Tento přípravek můžet být podáván pouze odborníkem seznámeným s použitím tohoto hydraulického stříkaček.</b>  <b>Manufacturer:</b> ROTTAPHARM Ltd., Damastown Industrial Park, Malahide-Dublin 15 Ireland	<b>GO-ON®</b> Navod na použitie, do rukou lékaře. <b>SK</b>	<b>Tento prípravok smú používať iba zaskladané osoby, ktoré sú oboznamené s jeho používaním.</b>  <b>Opis</b> Círky bezbarvý roztok v jednorázové sáčkové obálce.	<b>Návod na použitie</b> <b>AKO POUŽÍVAŤ GO-ON®</b> Injekčnú stříkačku vyberte zo svršného obalu. V případě, že sa připravok uchovával v chladničce (pozri Uchovávanie), vyberte ho 20-30 minut před použitím.	<b>Špeciálne upozornenia</b> Dlhodobé viskoelastické náhradu synoviaľnej tekutiny v kĺbe kolena a ramennom kĺbu možno použiť iba v prípadoch určených na synoviuľné kĺboch, kde vzhľadom na súčasné lubrikačné funkcie je potrebné aplikovať ledového obkladu na postavený klobouk.	<b>Informácia o preprace dla pacienta</b> Naleží započať sie s właściwościami preparatu, w których w przeszłości wystąpiła nadwrażliwość na którykolwiek ze składników preparatu oraz w przypadku chorób zapalnych stawów, takich jak reumatoidalne zapalenie stawów lub choroba Bechterecka.	<b>PRZECIWWSKAZANIA</b> GO-ON® nie może być stosowany w pacjentów, u których w przeszłości wystąpiła nadwrażliwość na którykolwiek ze składników preparatu oraz w przypadku chorób zapalnych stawów, takich jak reumatoidalne zapalenie stawów lub choroba Bechterecka.
